

Software Structure & Module Proposal

Proposed Workflow and Operational Modules

SYSTEM ARCHITECTURE

This document outlines the proposed software structure to streamline operations from initial measurement to final installation. The system is divided into functional modules designed to centralize data, improve tracking, and automate operational updates.

MOD 01 Order ID (Centralized Hub)

Consists of all documents (Quotation, Confirmation PDF, Measurement Sheet). The Order ID will act as the central hub, linking everything together from the initial quotation through to installation and final payment.

MOD 02 QR Code Integration

QR codes will be pasted on Frames & Shutters based on the Order ID. The QR code will be scanned at the assembly/glazing stage to instantly mark the specific frame or shutter as "ready" in the software.

MOD 03 Glass Tracking

When a glass order is received, the PI (Proforma Invoice) of the glass order will be uploaded along with details regarding how many glasses have been received and how many are broken. The shutters with broken/pending glasses will be visually marked in the software, and that specific window will be marked as "pending" due to glass breakage.

MOD 04 Measurement Storage Database (Version-wise)

All measurement sheets will be uploaded to the database by the measurement taker. These sheets will initially only contain the measurements and the client's name. After a quote is provided, or by the production engineer's decision, the measurement sheet will be linked to an Order ID. If a measurement is revised, the version of the measurement in the Order ID should change—showing the newer measurement sheet while keeping the older sheet safely stored in the database. The measurement taker should also select what type of measurement is being uploaded (e.g., Quotation Measurement or Final Measurement).

MOD 05 Rate Approval Section

Finished quotes will be uploaded by the quotation team, detailing Window Qty, SqFt, Glass Type, Client Name, and Location, along with the Quotation file for reference. A notification will automatically be sent to Uday Sir regarding the quotation pending for rate approval. Uday Sir will be able to easily see which quotes are pending for his approval. After providing the rate, the software will notify the quotation member to revise the quote accordingly.

Software Structure & Module Proposal

Operational Modules (Continued)

SYSTEM ARCHITECTURE

MOD 06 Window-wise Readiness

The system will track readiness on a per-window basis (e.g., indicating that 18 out of 20 windows are ready and 2 windows are pending). There will be an option to explicitly mark why the windows are pending (e.g., Glass pending, Profile not in stock, Hardware not available, Customer decision changes).

MOD 07 Order Value & Payment Tracking

The final decided value of an order will be securely logged and present in the software. There will also be a dedicated option to record exactly how much payment has been received to date against that total order value.

MOD 08 Balance Payment Automated Message Generator

Once all the frames and shutters within a given order are marked as ready, the system will instantly generate a balance payment message. It will alert the user, prompting them to send this automated, pre-formatted message directly to the customer.

MOD 09 Installation Scheduling

Installation team members will be added in this section along with their contact info. Once the installation of an order has been approved/decided, the user will be able to select an installation member from a drop-down menu to schedule the installation. This action will automatically trigger a notification sending the installation member the Order Details and Client Location.
