Project and Lot Pages

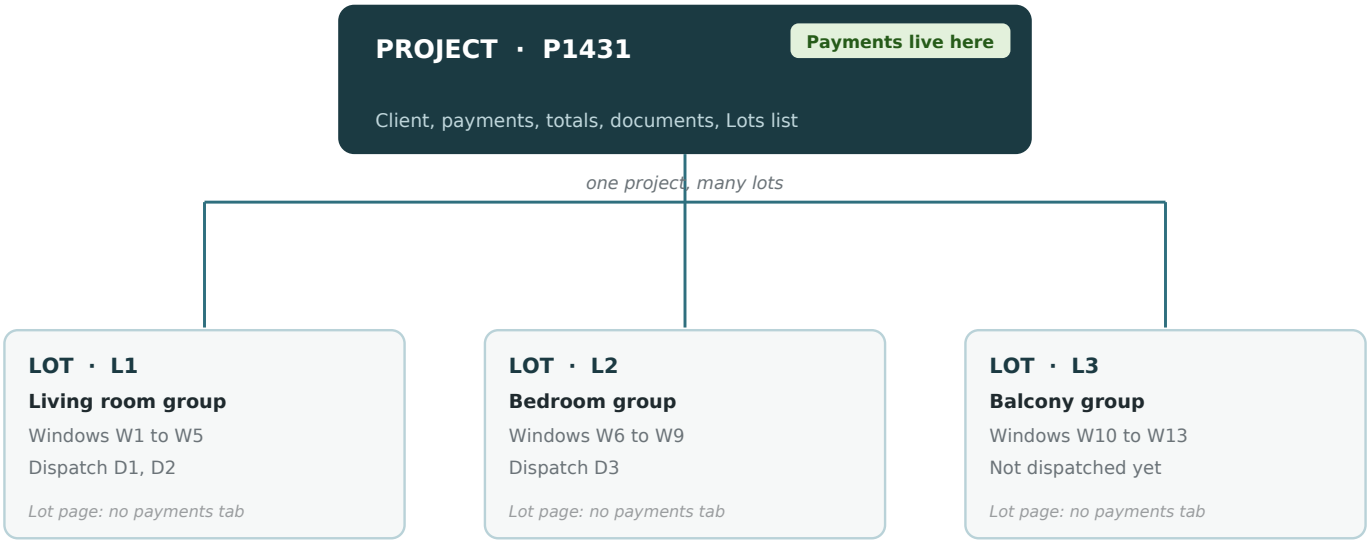

Guide for the IT team, to follow the Order ID screen brief

Prepared 11 Oct 2026 · Companion to Order Screen and Data Linking (Revised)

Lots are the middle level between a project and its windows. Payments sit only on the project. Lot pages are built from the project automatically, so IT does not have to design them one by one. Each lot page mirrors the project page, minus the payments tab.

1 How the three levels fit together

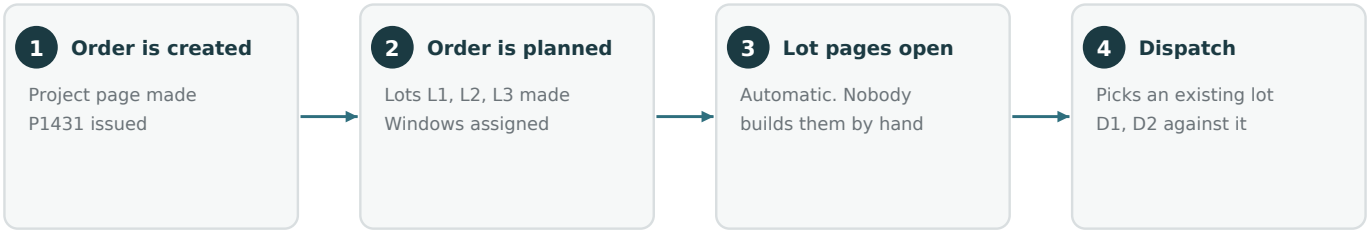

Project at the top, lots below it, windows inside the lots.

- **Project** (P1431): the client, payments, target, fulfilled totals, progress and the list of lots.
- **Lot** (P1431-L1): a group of windows that ships together. It has its own status, dispatch and window list.
- **Window**: sits inside one lot. Its frame and shutter pieces each have their own QR, as in section 5 of the brief.

2 How lot pages get created

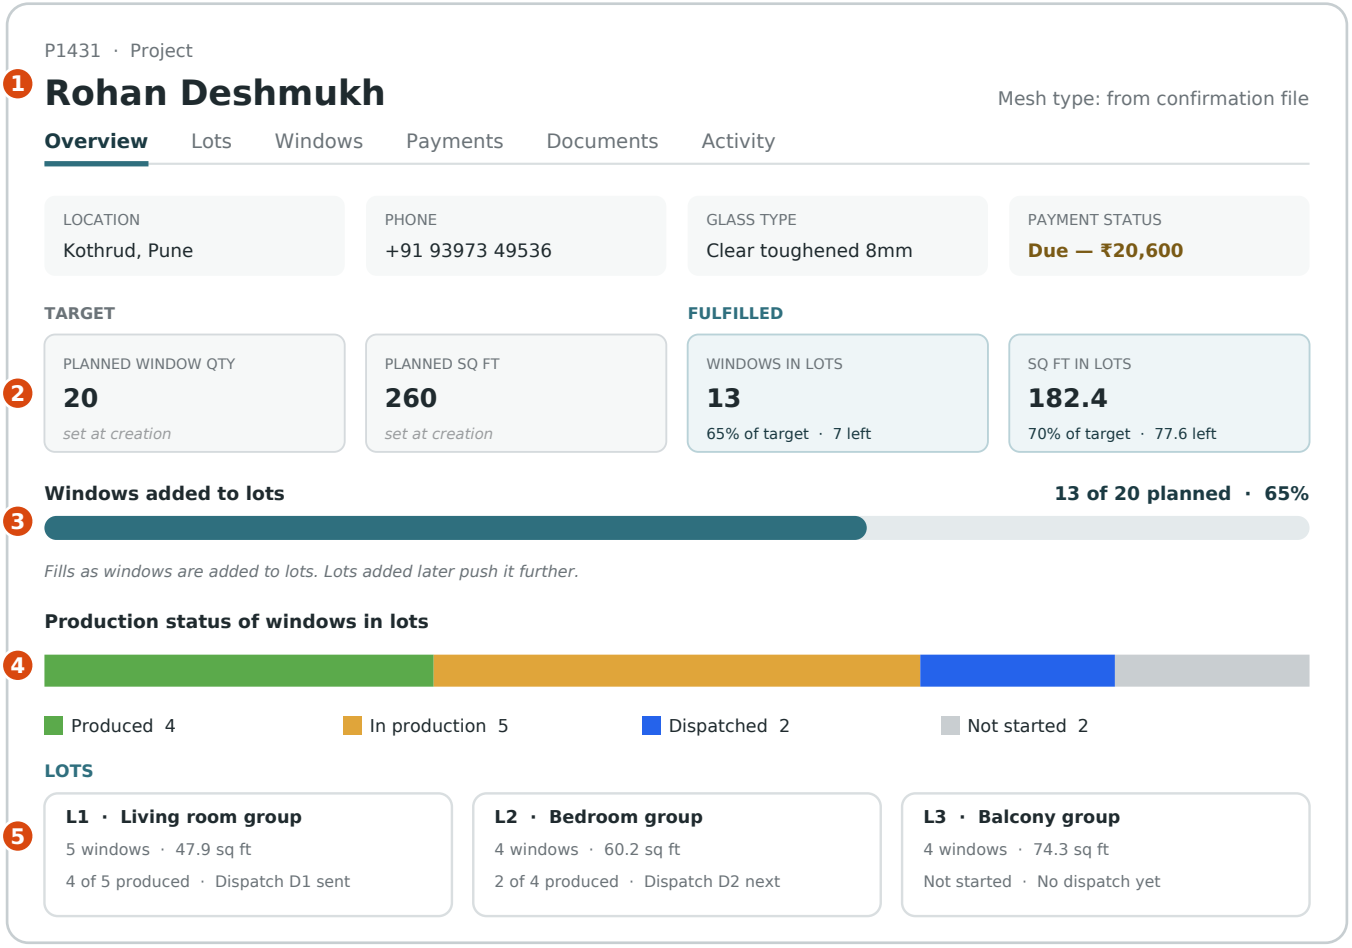

Nobody builds a lot page by hand. It follows from planning.

- The project page is made when the order is created. Its ID is the order ID (P1431).
- Lots are created when the order is planned. Each lot gets an ID (P1431-L1, P1431-L2) and a lot page opens from it.
- A lot page cannot be created on its own. Adding a lot from the project page creates the lot and its page together.
- Deleting a lot is only allowed while nothing in it has been scanned or dispatched.

3 Project page: the parent summary

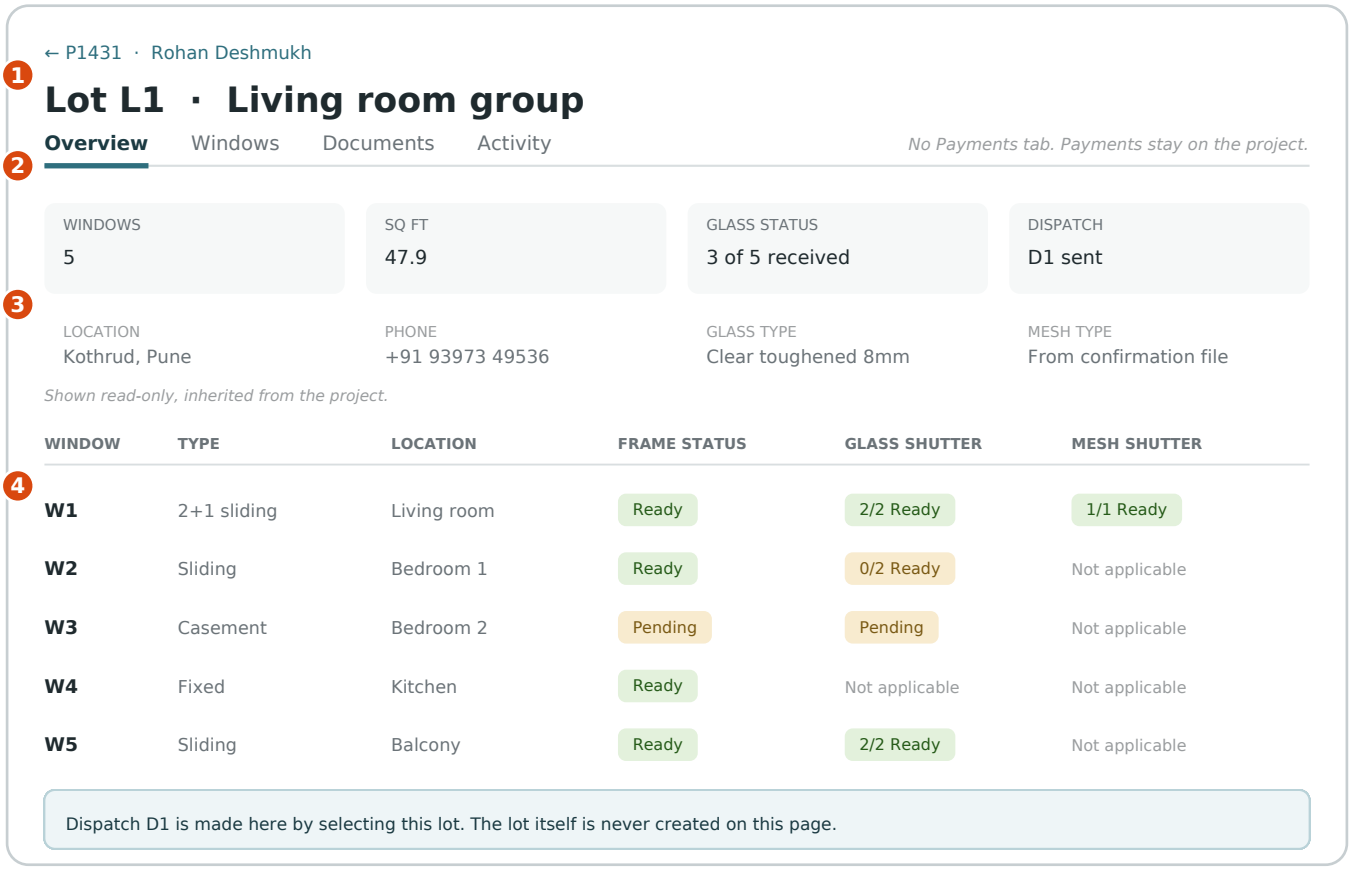

Payments, totals and the list of lots live here.

Key: 1 Header with client name and mesh type. 2 Target boxes, typed in once at creation, and Fulfilled boxes that grow as lots are added, with % of target and what is left. 3 Progress bar that fills as windows join lots. 4 Production breakdown: produced, in production, dispatched, not started. 5 Lot cards, each opening its own lot page.

4 Lot page: a retail-style page without payments

Same look as the project page, with the payments tab removed.

Key: 1 Breadcrumb back to the project. 2 Tabs, with no Payments tab. 3 Inherited details, read-only. 4 Window list with the same status rules as the Order ID screen.

5 Which tab goes where

The only real difference between the two pages is the payments tab.

Tab	Project page	Lot page
Overview	Yes. Totals rolled up from all lots.	Yes. Totals for this lot only.
Lots	Yes. The list of lots, one card each.	No. A lot does not contain lots.
Windows	Yes. All windows across the lots.	Yes. Only this lot's windows.
Payments	**Yes. The only place payments live.**	**No tab.** Payment status is not shown.
Documents	Yes. Confirmation file and quotation.	Yes. Only the lot's labels and dispatch notes.
Activity	Yes. Everything for the order.	Yes. Scans and dispatches for this lot.

6 What rolls up from lots to the project

Figure	Rule
Window quantity, sq ft	Sum of all lots. Counted from the window table, never typed in.
Glass status	'All received' only when every lot is received. Otherwise show the count.
Windows ready	Sum of ready windows across all lots, shown as x / total.
Planned qty and planned sq ft	Typed in once when the project is created. Not rolled up. They are the target for the progress bar.
Payment status and balance	Project only. Lots never store payments, so there is no double counting.
Dispatch	Each lot has its own dispatch history (D1, D2). The project only lists them.

7 Build checklist for the IT team

- ☐ Create the project page automatically when an order is created. Its ID is the order ID.
- ☐ Target boxes are editable only until the first lot is created. After that, a change needs a logged reason.
- ☐ Fulfilled boxes show % of target and how much is left, so the team sees the gap at a glance.
- ☐ Ask for planned window quantity and planned sq ft at project creation. Store them as the targets.
- ☐ Show a progress bar: windows in lots against planned quantity. It fills as windows are added.
- ☐ Show Fulfilled windows and Fulfilled sq ft. Both grow each time a lot is added.
- ☐ On the project page, replace the lifecycle bar with a production breakdown: produced, in production, dispatched, not started.
- ☐ Create lot pages when the order is planned. Lot IDs follow the pattern P1431-L1, P1431-L2.
- ☐ Show the lot list on the project page. Each card opens its lot page.
- ☐ Remove the Payments tab from lot pages. Payment status is shown only on the project.
- ☐ Roll up totals on the project from its lots. Do not store totals twice.
- ☐ Show Location, Phone, Glass type and Mesh type on lot pages as read-only, inherited from the project.
- ☐ Dispatch is made from a lot page by selecting that lot. Dispatch never creates a lot.
- ☐ Block lot deletion once any piece in it has been scanned or dispatched.
